Git/GitHub Collaborative Development Using Fork-and-Pull Request Workflow

1. Aim

To demonstrate collaborative software development using Git and GitHub by following the fork-and-pull request workflow, including repository forking, cloning, branching, committing, pushing, reviewing and submitting changes through a Pull Request.

2. Procedure

1. Open GitHub and select a public repository, octocat/Hello-World.
2. Fork the repository into the GitHub account.
3. Clone the forked repository to the local machine using Git.
4. Navigate to the project directory using cd Hello-World.
5. Create a new feature branch using git switch -c feature/update-readme.
6. Open the project and modify the README file by adding project contribution details.
7. Stage the modified file using git add README.
8. Commit the changes using git commit -m "Update README contribution details".
9. Push the feature branch to GitHub using git push -u origin feature/update-readme.
10. Open GitHub and create a Pull Request from the feature branch to the original repository's default branch (master in this demonstration).
11. Review the changes and provide feedback through comments or a review.
12. Respond to reviewer feedback with additional commits if necessary.
13. Merge the Pull Request after approval, if authorized by the repository maintainer.

3. Input

Repository URL:
https://github.com/octocat/Hello-World

Fork repository:
https://github.com/ranjitha7q/Hello-World

Feature branch:
feature/update-readme

Modified file: README

Input modification:
Added a Project Contribution section containing information about collaborative development, feature branches, commits, and pull requests.

Git commands used:

git clone https://github.com/ranjitha7q/Hello-World.git

cd Hello-World

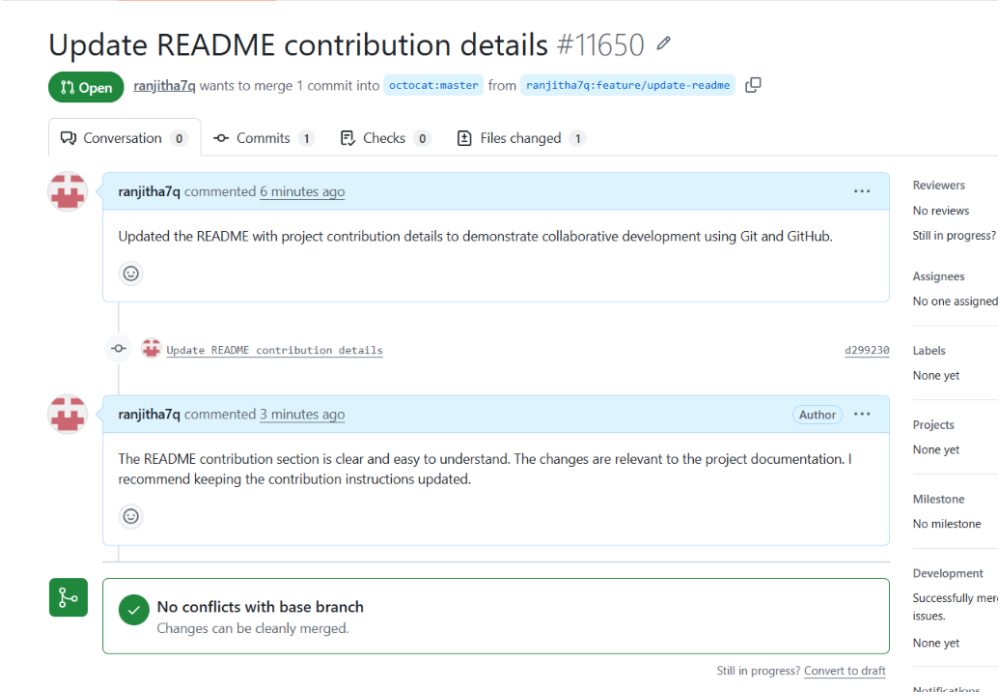

git switch -c feature/update-readme

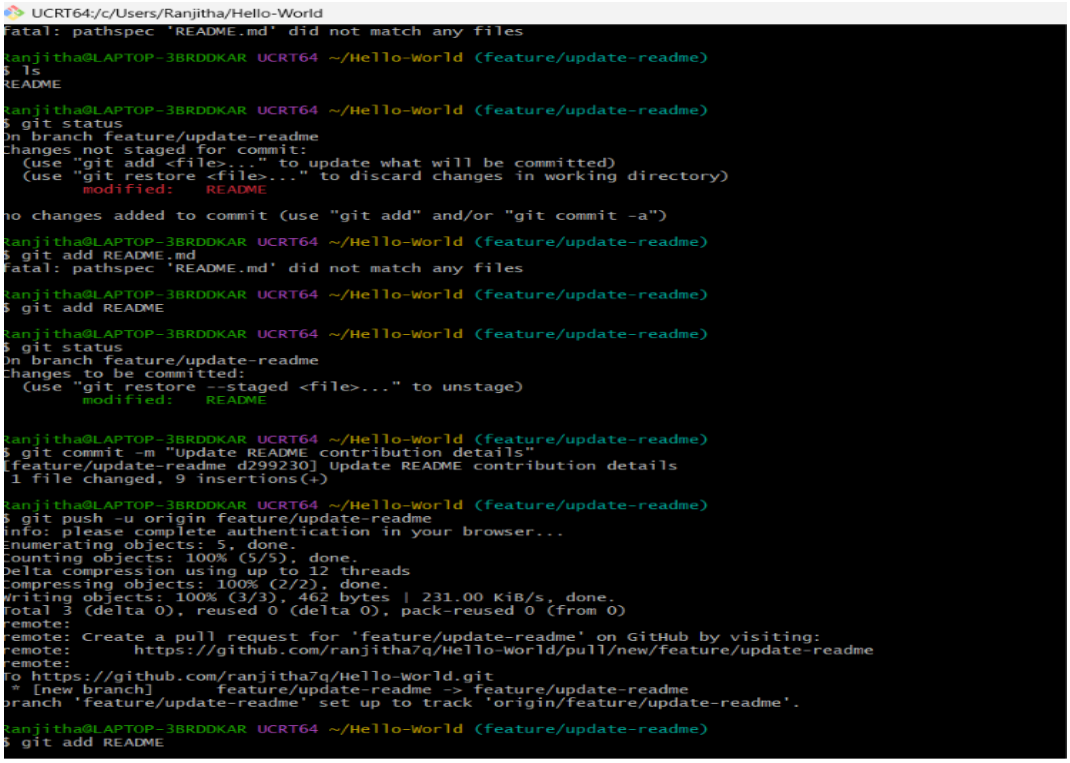

git add README

git commit -m "Update README contribution details"

git push -u origin feature/update-readme

4. Output

Pull Request Link:
https://github.com/octocat/Hello-World/pull/11650

5. Result

Successfully demonstrated collaborative software development using the Git and GitHub fork-and-pull request workflow. The repository was forked, cloned, modified, committed and pushed, and a Pull Request was created for review. The Pull Request is awaiting approval, and merging has not yet been completed.
