Experiment 5 : MoSCoW Prioritization for Library Management System

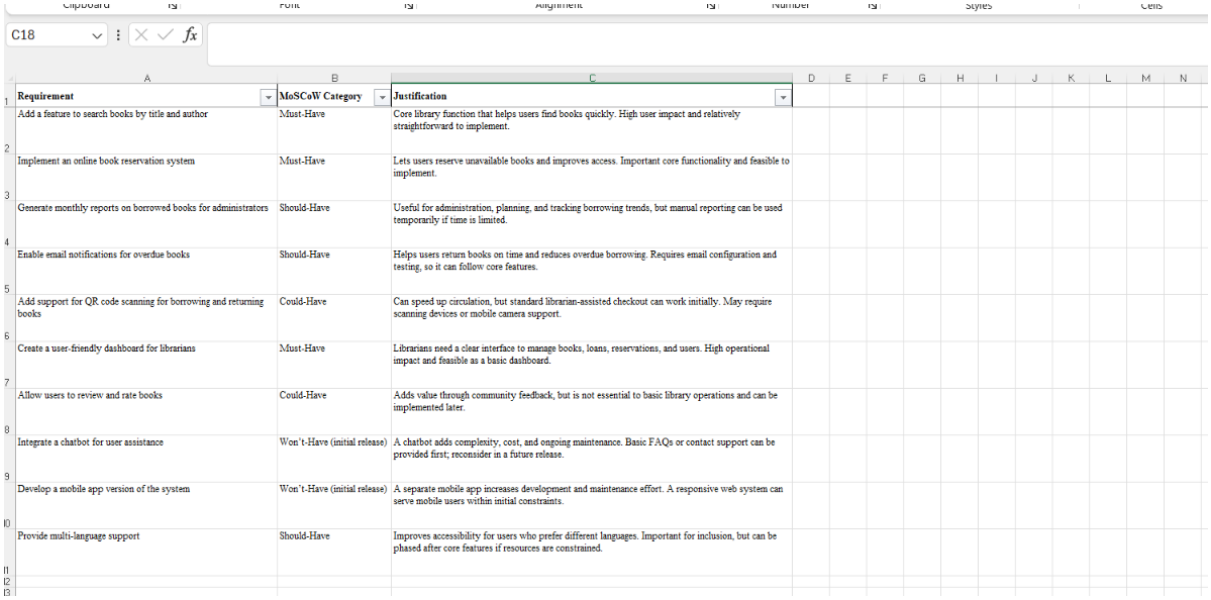

Aim

To categorize the requirements of a Library Management System using the MoSCoW prioritization method based on user impact, feasibility, time, budget, and resource constraints.

Procedure

1. Identify the ten requirements of the Library Management System.
2. Analyze each requirement based on its importance to users and stakeholders.
3. Evaluate the feasibility of implementing each requirement within the available time, budget, and resources.
4. Classify the requirements into four MoSCoW categories:
    - Must-Have: Essential requirements.
    - Should-Have: Important requirements that can be implemented later if necessary.
    - Could-Have: Optional features that provide additional benefits.
    - Won't-Have: Features excluded from the current release.
5. Record each requirement and its category in an Excel spreadsheet.
6. Provide a justification for each classification.
7. Review the completed spreadsheet and submit it.

Output

Requirement	MoSCoW Category	Justification
Add a feature to search books by title and author	Must-Have	Core library function that helps users find books quickly. High user impact and relatively straightforward to implement.
Implement an online book reservation system	Must-Have	Lets users reserve unavailable books and improves access. Important core functionality and feasible to implement.
Generate monthly reports on borrowed books for administrators	Should-Have	Useful for administration, planning, and tracking borrowing trends, but manual reporting can be used temporarily if time is limited.
Enable email notifications for overdue books	Should-Have	Helps users return books on time and reduces overdue borrowing. Requires email configuration and testing, so it can follow core features.
Add support for QR code scanning for borrowing and returning books	Could-Have	Can speed up circulation, but standard librarian-assisted checkout can work initially. May require scanning devices or mobile camera support.
Create a user-friendly dashboard for librarians	Must-Have	Librarians need a clear interface to manage books, loans, reservations, and users. High operational impact and feasible as a basic dashboard.
Allow users to review and rate books	Could-Have	Adds value through community feedback, but is not essential to basic library operations and can be implemented later.
Integrate a chatbot for user assistance	Won't-Have (initial release)	A chatbot adds complexity, cost, and ongoing maintenance. Basic FAQs or contact support can be provided first; reconsider in a future release.
Develop a mobile app version of the system	Won't-Have (initial release)	A separate mobile app increases development and maintenance effort. A responsive web system can serve mobile users within initial constraints.
Provide multi-language support	Should-Have	Improves accessibility for users who prefer different languages. Important for inclusion, but can be phased after core features if resources are constrained.

Result

The Library Management System requirements were successfully categorized using the MoSCoW method. Each requirement was prioritized based on its importance, user impact, and implementation feasibility, helping the team plan the project effectively within the available constraints.
